MICROWAVE OVEN WITH GRILL AND CONVECTION

MODELS **R-871(W)**
R-871(B)
R-871(K)

In interests of user-safety the oven should be restored to its original condition and only parts identical to those specified should be used.

SHARP CORPORATION

CAUTION MICROWAVE RADIATION

Personnel should not be exposed to the microwave energy which may radiate from the magnetron or other microwave generating devices if it is improperly used or connected. All input and output microwave connections, waveguides, flanges and gaskets must be secured.

Never operate the device without a microwave energy absorbing load attached.
Never look into an open waveguide or antenna while the device is energized.

WARNING MICKROVAGGSSTRALING

Personal får inte utsättas för mikrovågsenergi som kan ustrala från magnetronen eller andre mikrovågsalstrande anordningar om dessa är felanslutna eller används på fel sätt. Alla in- och utgångsanslutningar för mikrovågor, vågledare, flänsar och packningar måste vara fast anslutna.

Mikrovågsgeneratorn får inte arbeta utan att absorberande belastning är ansluten. Titta aldrig in i en öppen vågledare eller antenn när mikrovågsgeneratorn är påkopplad eller laddad.

VAROITUS MIKROAALTOSÄTELYÄ

Käyttäjä ei saa joutua alittiaksi mikroaaltoenergialle, jota voi säteillä magnetronista tai muusta mikroaaltoja kehittävästä laitteesta, jos sitä käytetään tai jos se kytketään väärin. Kaikkien mikroaaltoliitintöjen sekä syöttö-että ulostulopuolella, aaltoputkien laippojen ja tilvisteliden tulee olla varmistettuja.

Mikroaaltouunnia ei koskaan saa käyttää ilman kuormaa jossa mikroaaltoenergiaa kuluu. Avoimeen aaltoputkeen tai antenniin ei koskaan saa katsoa virran ollessa kytkettynä.

ADVARSEL MIKROBØLGESTRÅLING

Personell må ikke utsettes for mikrobølge-energi som kan utståles fra magnetronen eller andre mikrobølge-generende deler dersom apparatet feilbetjenes eller blir feiltikoplet. Alle inn-og ut-tilkoplinger i forbindelse med mikrobølge-strålingen, bølgeledere, flenser og tetningsringer/pakninger må festes ordentlig.

Aldri bruk apparatet med mindre en mikrobølge-absorberende last er plassert i ovnsrommet.

Aldri se direkte inn i en åpen bølgeleder eller antennen mens apparatet er strømførende.

ADVARSEL MIKROBØLGEBESTRÅLING

Man bør ikke udsætte sig for mikrobølgebestråling fra magnetronen eller andre mikrobølgefrembringende anordninger, hvilket kan ske hvis apparatet er forkert tilsluttet eller bruges forkert. Alle mikrobølgeindgange og-udgange, bølgeledere, flanger og tætningsstrimler må være forsvarligt udført.

Anvend aldrig ovnen uden en mikrobølgesabsorberende anordning. Se aldrig ind i en åben bølgeleder eller antennen, mens ovnen er i brug.

SERVICE MANUAL

SHARP

GRILL AND CONVECTION MICROWAVE OVEN

R871

GENERAL IMPORTANT INFORMATION

This Manual has been prepared to provide Sharp Corp. Service engineers with Operation and Service Information.

It is recommended that service engineers carefully study the entire text of this manual, so they will be qualified to render satisfactory customer service.

CAUTION

MICROWAVE RADIATION

DO NOT BECOME EXPOSED TO RADIATION FROM THE MICROWAVE GENERATOR OR OTHER PARTS THAT CONDUCT MICROWAVE ENERGY.

WARNING

Note: The parts marked "*" are used in voltage more than 250V. (Parts List)

Anm: Delar märkta med "*" har en spänning överstigande 250V.

Huom: Huolto-ohjeeseen merkity "tähdellä" osat joissa jännite on yli 250 V.

Bemerk: Deler som er merket "asterisk" er utsatt for spenninger over 250V til jord.

Bemærk: "Deler mærket med stjerne benyttes med højere spænding end 250 volt.

WARNING

Never operate the oven until the following points are ensured.

- (A) The door is tightly closed.
- (B) The door brackets and hinges are not defective.
- (C) The door packing is not damaged.
- (D) The door is not deformed or warped.
- (E) There is not any other visible damage with the oven.

Servicing and repair work must be carried out only by trained Service Engineers.

All the parts marked "*" on parts list are used at voltages more than 250V.

Removal of the outer wrap gives access to potentials above 250V.

All the parts marked "Δ" on the parts list may cause undue microwave exposure, by themselves, or when they are damaged loosened or removed.

SHARP CORPORATION

OSAKA, JAPAN

SERVICING

WARNING TO SERVICE PERSONNEL

(GB) Microwave ovens contain circuitry capable of producing very high voltage and current, contact with following parts will result in electrocution.
High voltage capacitor, Power transformer, Magnetron, High voltage rectifier assembly, High voltage harness.

REMEMBER TO CHECK 3D

- 1) Disconnect the supply.
- 2) Door opened, and wedged open.
- 3) Discharge high voltage capacitor.

WARNING AGAINST THE CHARGE OF THE HIGH-VOLTAGE CAPACITOR

The high-voltage capacitor remains charged about 60 seconds after the oven has been switched off. Wait for 60 seconds and then short-circuit the connection of the high-voltage capacitor (that is, of the connecting lead of the high-voltage rectifier) against the chassis with the use of an insulated screwdriver.

Sharp recommend that wherever possible fault-finding is carried out with the supply disconnected. It may in, some cases, be necessary to connect the supply after the outer case has been removed, in this event carry out 3D checks and then disconnect the leads to the primary of the power transformer. Ensure that these leads remain isolated from other components and the oven chassis. (Use insulation tape if necessary.) When the testing is completed carry out 3D checks and reconnect the leads to the primary of the power transformer.

REMEMBER TO CHECK 4R

- 1) Reconnect all leads removed from components during testing.
- 2) Replace the outer case (cabinet).
- 3) Reconnect the supply.
- 4) Run the oven. Check all functions.

Microwave ovens should not be run empty. To test for the presence of microwave energy within a cavity, place a cup of cold water on the oven turntable, close the door and set the power to HIGH and set the microwave timer for two (2) minutes. When the two minutes has elapsed (timer at zero) carefully check that the water is now hot. If the water remains cold carry out 3D checks and re-examine the connections to the component being tested.

When all service work is completed, and the oven is fully assembled, the microwave power output should be checked and a microwave leakage test carried out.

(NL) Magnetronovens bevatten circuits die een zeer hoge spanning en stroom kunnen voortbrengen. Contact met de volgende onderdelen kan elektrocutie tot gevolg hebben.
Hoogspanningscondensator, hoogspanningstransformator, magnetron, hoogspanningsgelijkrichter, hoogspannings kabelboom.

VERGEET DE VOLGENDE 3 STAPPEN NIET

- 1) Haal de stekker uit het stopcontact.
- 2) Open de deur en zorg ervoor dat hij niet dicht kan vallen.
- 3) Ontlaad de hoogspanningscondensator.

PAS OP VOOR DE ELECTRISCHE LADING VAN DE HOOGSPANNINGSCONDENSATOR

De hoogspanningscondensator blijft nog ongeveer 60 seconden lang opgeladen, nadat de oven is uitgeschakeld. Wacht 60 seconden voordat u de verbinding van de hoogspanningscondensator (m.a.w. de verbindingstraat van de hoogspanningsgelijkrichter) met een geïsoleerde schroovedraaier kortsleut tegen het chassis.

Sharp beveelt ten sterkste aan dat, voor zover mogelijk, defecten worden opgespoord wanneer de stekker uit het stopcontact is gehaald. Soms is het nodig om de stroomtoevoer weer tot stand te brengen nadat de buitenmantel verwijderd is. Herhaal dan de bovengenoemde 3 stappen en haal de elektrische draden uit de primaire zijde van de vermogenstransformator. Zorg ervoor dat deze draden geïsoleerd blijven van andere elementen en van het chassis van de oven. (Gebruik zo nodig isolatieband.) Wanneer de test is uitgevoerd, herhaalt u de bovenstaande 3 stappen en verbindt u de elektrische draden weer aan de primaire zijde van de vermogenstransformator.

VERGEET DE VOLGENDE 4 STAPPEN NIET

- 1) Sluit de draden weer aan die zijn losgehaald voor de test.
- 2) Plaats de buitenmantel weer om het toestel heen (kabinet).
- 3) Stop de stekker weer in het stopcontact.
- 4) Zet de oven aan. Controleer alle functies.

Magnetronovens mogen niet leeg aangezet worden. Om te controleren of er microgolf-energie binnen de oven wordt geproduceerd, plaatst u een mok met koud water op de draaitafel van de oven, sluit de deur, zet de oven op HIGH en stelt de klok van de magnetron in op twee (2) minuten. Wanneer de twee minuten voorbij zijn (klok staat op nul), controleert u voorzichtig of het water heet is. Indien het water nog steeds koud is, herhaalt u de allereerste drie stappen en controleer nogmaals de aansluitingen naar de geteste onderdelen.

Wanneer alle reparaties zijn uitgevoerd en de oven weer in elkaar is gezet, moet de het magnetronvermogen worden gecontroleerd en moet worden gecontroleerd of er geen microgolflekkage is.

SERVICING

E Los hornos de microondas contienen circuitos eléctricos capaces de producir voltajes de alta tensión y descargas eléctricas. Para evitar el riesgo de electrocución, absténgase de tocar los siguientes componentes: condensador de alta tensión, transformador de alta tensión, magnetrón, dispositivo del rectificador de alta tensión y arnés de alta tensión.

RECUERDE LA COMPROBACION 3D

- 1) Desconecte la alimentación.
- 2) Deje la puerta abierta y calzada.
- 3) Descargue el condensador de alto voltaje.

ADVERTENCIA SOBRE LA CARGA DEL CONDENSADOR DE ALTO VOLTAJE

El condensador de alto voltaje permanece cargado unos 60 segundos después de haber apagado el horno. Espere 60 segundos y luego ponga en cortocircuito la conexión del condensador de alto voltaje (esto es, del conductor de conexión del rectificador de alto voltaje) al chasis con un destornillador de mango aislado.

Se recomienda encarecidamente que siempre que sea posible la localización de fallos se realice con la alimentación desconectada. Puede ser que en algunos casos sea necesario conectar la alimentación después de haber retirado la carcasa exterior. En este caso, realice las comprobaciones 3D y luego desconecte los conductores del primario del transformador de alimentación. Asegúrese de que estos conductores permanezcan aislados de otros componentes y del chasis del horno. (Use cinta aislante si es necesario). Cuando termine la prueba efectúe las comprobaciones 3D y reconecte los conductores al primario del transformador de alimentación.

RECUERDE LA COMPROBACION 4C

- 1) Conecte todos los componentes desconectados de los componentes durante la prueba.
- 2) Coloque la carcasa exterior (cabina).
- 3) Conecte la alimentación.
- 4) Compruebe todas sus funciones después de poner en marcha el horno.

Los hornos de microondas no deben funcionar vacíos. Para comprobar la presencia de energía de microondas dentro de una cavidad, coloque una taza de agua fría en el plato giratorio del horno, cierre la puerta y ponga la potencia en HIGH (alta) y coloque el temporizador en dos (2) minutos. Cuando transcurran los dos minutos (temporizador a cero) compruebe cuidadosamente que el agua se ha calentado. Si el agua permaneciese fría, efectúe las comprobaciones 3D y vuelva a examinar las conexiones de los componentes que han sido probados.

Cuando haya terminado la intervención en el equipo y el horno haya sido ensamblado de nuevo completamente, deberá comprobar la potencia de salida de microondas y realizar una prueba de fugas de microondas.

SV Mikrovågsugnar innehåller kretsar som producerar mycket höga spänningar och strömmar. Kontakt med följande komponenter kan leda till dödsfall: Högspänningskondensator, transformator, magnetron, högspänningsslikriktare, högspänningss kablage.

KOM IHÅG ATT KONTROLLERA 3 STEG

- 1) Koppla från strömkällan.
- 2) Öppna dörren på glänt.
- 3) Ladda ur högspänningskondensatorn.

VARNING FÖR LADDNINGEN I HÖGPÄNNINGSKONDENSATORN

Högspänningskondensatorn är laddad i 60 sekunder efter det att ugnen stängts av. Vänta 60 sekunder och korislut sedan kondensatorns anslutning (dvs anslutningen till högspänningsslikriktaren) till chassiet med hjälp av en isolerad skruvmejsel.

Sharp rekommenderar att felsökning sker med strömmen fräckkopplad. Ibland kan det vara nödvändigt att koppla på strömmen efter det att höljet avlägsnats, utförda 3 Steg kontrollen och koppla sedan från ledarna till transformatorn primärsida. Se till att ledarna är isolerade från andra komponenter och chassiet. (Använd isoleringsband om det behövs). När Du testat färdigt utför Du 3 Steg kontrollen och ansluter ledningarna till transformatorn primärsida igen.

KOM IHÅG ATT KONTROLLERA 4 STEG

- 1) Anslut alla ledningar som används vid testning
- 2) Sätt tillbaka ytterhöljet.
- 3) Anslut strömkällan på nytt.
- 4) Sätt på ugnen. Kontrollera alla funktioner.

Mikrovågsugnar får inte användas tomma. Kontrollera mikrovågsstrålningen i olika delar av ugnen genom att placera en kopp med kallt vatten på ugnens tallrik, ställ dörren, ställ in HIGH och ställ in 2 minuter på timern. När två minuter har gått (timern visar 0) kontrollerar du om vattnet är varmt. Om vattnet fortfarande är kallt utför Du 3 steg kontroller och kontrollerar anslutningarna till varje enskild komponent på nytt.

När all service är klar och ugnen ihopskruvad skall ugnens uteffekt och eventuellt mikrovågläckage kontrolleras.

SERVICING

I forni a microonde contengono un circuito elettrico in grado di generare tensioni e correnti estremamente elevate. L'eventuale contatto con i seguenti componenti può causare la folgorazione: condensatore ad alta tensione; trasformatore ad alta tensione; magnetron; rettificatore alta tensione; cablaggio ad alta tensione.

TRE OPERAZIONI IMPORTANTI PER INCOMINCIARE

- 1) Scollegare l'alimentazione elettrica.
- 2) Verificare che la porta sia bloccata in posizione aperta.
- 3) Scaricare il condensatore ad alta tensione.

ATTENZIONE AL CONDENSATORE AD ALTA TENSIONE: PUO ESSERE CARICO

Il condensatore ad alta tensione rimane carico per circa 60 secondi dopo lo spegnimento del forno. Occorre quindi spettare 60 secondi prima di cortocircuitare, utilizzando un cacciavite con impugnatura isolata, il collegamento del condensatore ad alta tensione (cioè del conduttore di collegamento del raddrizzatore ad alta tensione) sul telaio del forno.

Sharp raccomanda, nei limiti del possibile, che la ricerca dei guasti avvenga in assenza di alimentazione elettrica. In alcuni casi tuttavia, può essere necessario alimentare l'apparecchio dopo aver rimosso la scatola esterna. In questo caso eseguire i tre controlli sopra citati e quindi scollegare i connettori dal primario del trasformatore. Assicurarsi che tali connettori non vengano a contatto con altri componenti, né con il telaio del forno (fare uso, se necessario, di nastro isolante). Al termine dell'intervento, eseguire nuovamente i tre controlli e ricollegare i conduttori al primario del trasformatore.

When troubleshooting the microwave oven, it is helpful to follow the Sequence of Operation in performing the checks. Many of the possible causes of trouble will require that a specific test be performed. These tests are given a procedure letter which will be found in the "Test Procedure" section.

QUATTRO VERIFICHE IMPORTANTI DA NON DIMENTICARE

- 1) Ricollegare tutti i conduttori staccati dai vari componenti durante l'intervento.
- 2) Rimontare la scatola esterna.
- 3) Ripristinare l'alimentazione elettrica.
- 4) Rimettere in funzione il forno. Controllare tutte le funzioni.

I forni a microonde non devono mai funzionare a vuoto. Per verificare la presenza di energia da microonde all'interno di una cavità, mettere una tazza di acqua fredda sul piatto rotante del forno, chiudere la porta, regolare la potenza su HIGH ed impostate il temporizzatore su due (2) minuti. Trascorsi i due minuti (temporizzatore a zero), controllare accuratamente che ora l'acqua sia calda. Se l'acqua è rimasta fredda, eseguire i tre controlli iniziali e verificare nuovamente i collegamenti del componente in questione.

Dopo aver portato a termine le operazioni di manutenzione e rimontato il forno, è necessario controllare la potenza delle microonde emesse ed eseguire un test per verificare che non vi sia alcuna dispersione.

CAUTION/WARNING

CAUTION MICROWAVE RADIATION

Service engineers should not be exposed to the microwave energy which may radiate from the magnetron or other microwave generating devices if it is improperly used or connected. All input and output microwave connections, waveguides, flanges and gaskets must be secured. Never operate the device without a microwave energy absorbing load attached. Never look into an open waveguide or antenna while the device is energized.

WARNING

Servicing and repair work must be carried out only by trained service engineers.
All the parts marked ** on parts list are used at voltages more than 250V.
Removal of the outer wrap gives access to potentials above 250V.
All the parts marked Δ on parts list may cause undue microwave exposure, by themselves, or when they are damaged, loosened or removed.

WARNING

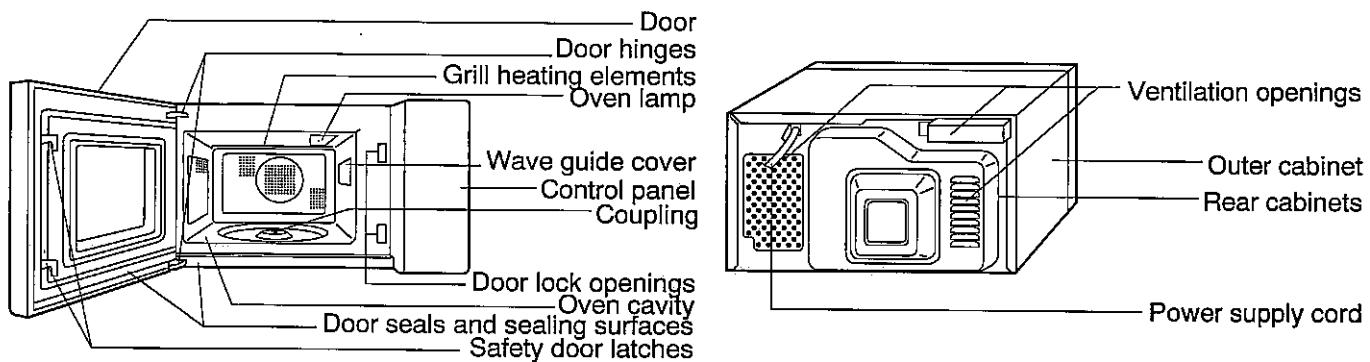

THIS APPLIANCE MUST BE EARTHED. THE WIRES IN THIS MAINS LEAD ARE COLOURED IN ACCORDANCE WITH THE FOLLOWING CODE:
GREEN-AND-YELLOW : EARTH BLUE : NEUTRAL BROWN : LIVE

PRODUCT DESCRIPTION

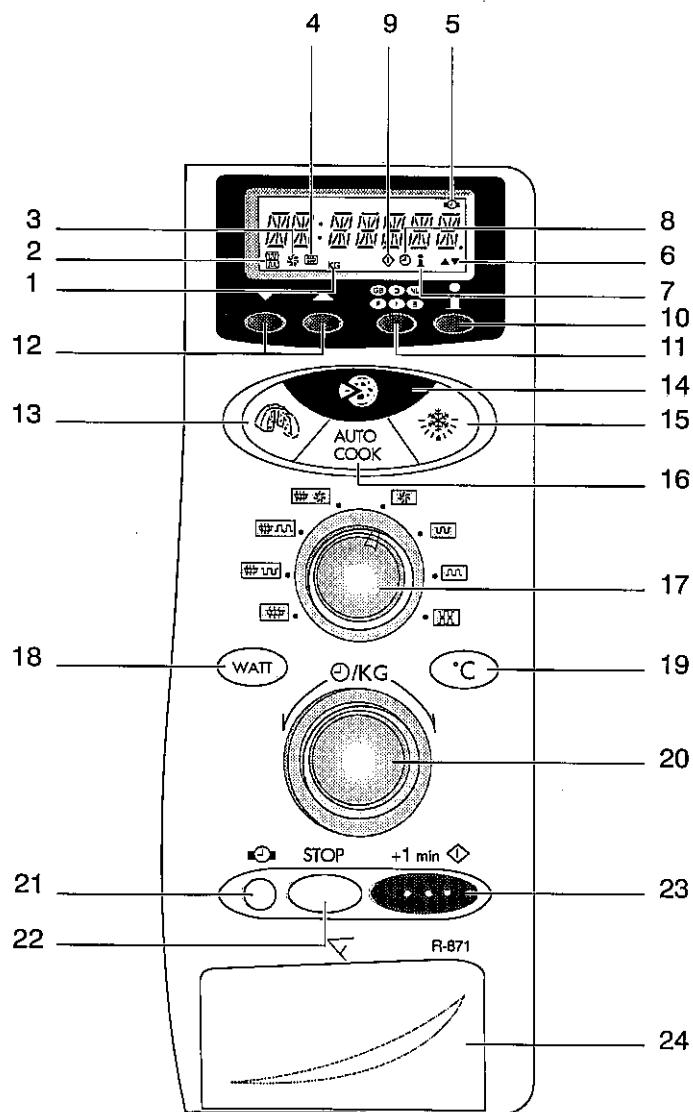

| ITEM | DESCRIPTION | | |
|---|--|--------------------------------|--------------|
| Power Requirements | 230 Volts / 50 Hertz / Single phase, 3 wire earthed | | |
| Power Consumption | Microwave cooking | 1.6kW | Approx. 7.5A |
| | Dual cooking (Microwave and Top Grill) | 2.8kW | Approx. 12A |
| | (Microwave and Bottom Grill) | 2.4kW | Approx. 11A |

OPERATION SEQUENCE

OFF CONDITION

Closing the oven door activates all door interlock switches (Monitored latch switch and stop switch).

IMPORTANT:

When the oven door is closed, the contacts COM-NC of the monitor switch SW2 must be open and the contacts (COM-NO) must be closed. When the microwave oven is plugged in a wall outlet (230V / 50Hz), 230 volts A.C. is supplied to the point A1 + A3 in the control unit.

Figure O-1 on page 34

1. The display flashes "88:88"
2. To set any programmes or set the clock, you must first touch the STOP key.
3. ":" appears in display.

NOTE: When the oven door is opened, the oven lamp comes on at this time.

MICROWAVE COOKING CONDITION

HIGH COOKING

Enter a desired cooking time with the Rotary Knob and start the oven by touching the START key.

Function sequence Figure O-2 on page 34

| CONNECTED COMPONENTS | RELAY |
|----------------------------|-------|
| Oven lamp, Turntable motor | RY1 |
| High voltage transformer | RY2 |
| Fan motor | RY5 |

1. 230 volts A.C. is supplied to the primary winding of the high voltage transformer. The voltage is converted to about 3.3 volts A.C. output on the filament winding and high voltage of approximately 2000 volts A.C. on the secondary winding.
2. The filament winding voltage (3.3 volts) heats the magnetron filament and the high voltage (2000 volts) is sent to the voltage doubling circuit, where it is doubled to negative voltage of approximately 4000 volts D.C..
3. The 2450 MHz microwave energy produced in the magnetron generates a wave length of 12.24 cm. This energy is channelled through the waveguide (transport channel) into the oven cavity, where the food is placed to be cooked.
4. When the cooking time is up, a signal tone is heard and the relays RY1 + RY2 + RY5 go back to their home position. The circuits to the oven lamp, high voltage transformer, fan motor and turntable motor are cut off.
5. When the oven door is opened during a cooking cycle, the switches come to the following condition.

| Switch | Contact | Condition | Oven Door |
|------------------------|---------|----------------|------------------|
| | | During Cooking | Open(No cooking) |
| Monitored latch Switch | COM-NO | Closed | Opened |
| Monitor Switch | COM-NO | Closed | Opened |
| Monitor Switch | COM-NC | Opened | Closed |
| Stop switch | COM-NO | Closed | Opened |

The circuit to the high voltage transformer, is cut off when the contact of relay RY2 contacts COM-NO of the monitored latch switch, and monitor switch SW2 are made open. The circuit to the fan motor is cut off when the relay RY5 is made open. The circuit to the turntable motor is cut off when the contacts COM-NO of the monitored latch switch are made open. The relays RY2 and RY5 are made

open when the door is opened. The oven lamp remains on even if the oven door is opened after the cooking cycle has been interrupted, because the relay RY1 stay closed. Shown in the display is remaining time.

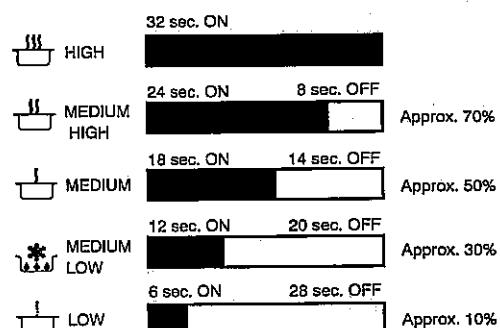

6. MONITOR SWITCH CIRCUIT

The monitor switch SW2 is mechanically controlled by the oven door, and monitors the operation of the monitored latch switch SW1.

- 6-1. When the oven door is opened during or after the cycle of a cooking program, the monitored latch switch SW1 and stop switch SW3 must open their contacts (COM-NO) first. After that the contacts (COM-NC) of the monitor switch SW2 can be closed and the contacts (COM-NO) of monitor switch SW2 are made open.
- 6-2. When the oven door is closed. The contacts (COM-NC) of the monitor switch SW2 must be opened and the contacts (COM-NO) of monitor switch SW2 must be closed. After that the contacts of the monitored latch switch SW1 and the stop switch SW3 are made closed.
- 6-3. When the oven door is opened and the contacts of the monitored latch switch SW1 remain closed, the fuse F2 F8A will blow. Because the relay RY1 and monitor switch SW2 are closed and a short circuit is caused.

MEDIUM HIGH, MEDIUM, MEDIUM LOW, LOW COOKING

When the microwave oven is preset for variable cooking power, the 230 volts A.C. power is supplied to the high voltage transformer intermittently within a 32-second time base through the relay contact which is coupled with the current-limiting relay RY2. The following levels of microwave power are given.

Note: The On/Off time ratio does not exactly correspond to the percentage of microwave power, because approx. 3 seconds are needed for heating up the magnetron filament.

CONVECTION COOKING CONDITION PREHEATING CONDITION (Figure O-4)

Program desired convection temperature by touching CONVECTION key. When the START key is touched, the following operations occur:

1. The coil of shut-off relays RY1, RY5 and RY6 are energized, the oven lamp, cooling fan motor, turntable motor and convection motor are turned on.
2. The coil of shut-off relays RY3 and RY4 are energized by the control unit and the main supply voltage is added to the

OPERATION SEQUENCE

top and bottom heater.

3. When the oven temperature reaches the selected preheat temperature, the following operations occur:
 - 3-1. The shut-off relays **RY3** and **RY4** are de-energized by the control unit temperature circuit and thermistor, opening the circuit to the top and bottom heating elements.
 - 3-2. The oven will continue to function for 15 minutes, turning the convection heating elements on and off, as needed to maintain the selected preheat temperature. The oven will shut-down completely after 15 minutes.

CONVECTION COOKING CONDITION (Figure O-4)

When the preheat temperature is reached, a beep signal will sound indicating that the holding temperature has been reached in the oven cavity. Open the door and place the food to be cooked in the oven. Program desired cooking time and convection temperature by turning the mode select switch to  'CONVECTION' and touching the $^{\circ}\text{C}$ key, and using the second rotary knob to set the time. When the START key is touched, the following operations occur:

1. The numbers of the digital readout start the count down to zero.
2. The oven lamp, cooling fan motor, turntable motor and convection motor are energized.
3. Relays **RY3** and **RY4** are energized (if the cavity temperature is lower than the selected temperature) and the main supply voltage is applied to the top and bottom heaters to return to the selected cooking temperature.
4. Upon completion of the cooking time, the audible signal will sound, and oven lamp, turntable motor, cooling fan motor and convection motor are de-energized. At the end of convection cycle, if the cavity air temperature is above 104°C , the circuit to **RY5** will be maintained (by the thermistor circuit) to continue operation of the cooling fan motor until temperature drops below 104°C , at that time the relay will be de-energized, turning off the fan motor.

GRILL COOKING CONDITION

TOP GRILL (Figure O-3a)

In this condition the food is cooked by grill heating element energy. Programme the desired cooking time and top grill mode by turning the mode select knob to  "TOP GRILL" and the second rotary knob to set the time. When the START key is touched, the following operations occur:

1. The numbers on the digital readout start the count down to zero.
2. The oven lamp, cooling fan motor and turntable motor are energized.
3. The relay **RY3** is energized and the main supply voltage is applied to the top grill heater.
4. Now the food is cooked by the top grill heater.

GRILL COOKING CONDITION

BOTTOM GRILL (Figure O-3b)

In this condition the food is cooked by bottom grill heating element energy. Program the desired cooking time and bottom grill mode by turning the mode select knob to  "BOTTOM GRILL" and the second rotary knob to set the time. When the START key is touched, the following operations occur:

1. The numbers on the digital readout start the count down to zero.
2. The oven lamp, cooling fan motor and turntable motor are energized.
3. The relay **RY4** is energized and the main supply voltage is applied to the bottom grill heater.
4. Now the food is cooked by the bottom grill heater.

GRILL COOKING CONDITION

TOP AND BOTTOM GRILL (Figure O-3c)

In this condition the food is cooked by the top and bottom grill heating element energy. Program the desired cooking time and top+bottom grill mode by turning the mode select knob to  "TOP & BOTTOM GRILL", and the second rotary knob to set the time. When the START key is touched, the following operations occur:

1. The numbers on the digital readout start the count down to zero.
2. The oven lamp, cooling fan motor and turntable motor are energized.
3. The relay **RY4** is energized and the main supply voltage is applied to the bottom grill heater.
4. The relay **RY3** is energized and the main supply voltage is applied to the top grill heater.
5. Now the food is cooked by the bottom grill heater.

DUAL COOKING CONDITION

MICROWAVE AND CONVECTION (Figure O-5a)

Program the desired cooking time and Dual cook mode by turning the mode select knob to  "DUAL COOK CONVECTION", and the second rotary knob to set the time. When the START key is touched, the following operations occur:

1. The numbers on the digital readout start the count down to zero.
2. The oven lamp, cooling fan motor, turntable motor and convection motor are energized.
3. Relay **RY4** is energized (if the cavity temperature is lower than the selected temperature) and the main supply voltage is applied to the bottom heater.
4. Relay **RY2** is energized and the microwave energy is generated by the magnetron.
5. During operation relay **RY2** will de-energize and relay **RY3** will be energized and the main supply voltage is applied to the top grill heater. This will continue to cycle throughout this mode.
6. Now the food is cooked by microwave and convection energy simultaneously.

DUAL COOKING CONDITION

MICROWAVE AND TOP GRILL (Figure O-5b)

Program the desired cooking time and Dual cook mode by turning the mode select knob to  "DUAL COOK TOP GRILL", and the second rotary knob to set the time. When the START key is touched, the following operations occur:

1. The numbers on the digital readout start the count down to zero.
2. The oven lamp, cooling fan motor and turntable motor are energized.
3. Relay **RY3** is energized and the main supply voltage is applied to the top heater.
4. Relay **RY2** is energized and the microwave energy is

FUNCTION OF IMPORTANT COMPONENTS

generated by the magnetron.

- Now the food is cooked by microwave and top grill simultaneously.

DUAL COOKING CONDITION

MICROWAVE AND BOTTOM GRILL (Figure O-5c)

Program the desired cooking time and Dual cook mode by turning the mode select knob to "DUAL COOK BOTTOM GRILL", and the second rotary knob to set the time. When the START key is touched, the following operations occur:

- The numbers on the digital readout start the count down to zero.
- The oven lamp, cooling fan motor and turntable motor are energized.
- Relay RY4 is energized and the main supply voltage is applied to the bottom heater.
- Relay RY2 is energized and the microwave energy is generated by the magnetron.
- Now the food is cooked by microwave and bottom grill simultaneously.

AUTO COOK

When the menu and quantity are input, the oven chooses cooking mode (Microwave, Convection, Grill or Dual) and sets cooking time automatically according to the pre-programmed information in IC-1 (LSI).

DOOR OPEN MECHANISM

The door can be opened by pushing the open button on the control panel. When the open button is pushed, the open lever pushes lower latch head on the door upward. The upper latch head is linked with the lower latch head, so now, the door can be opened.

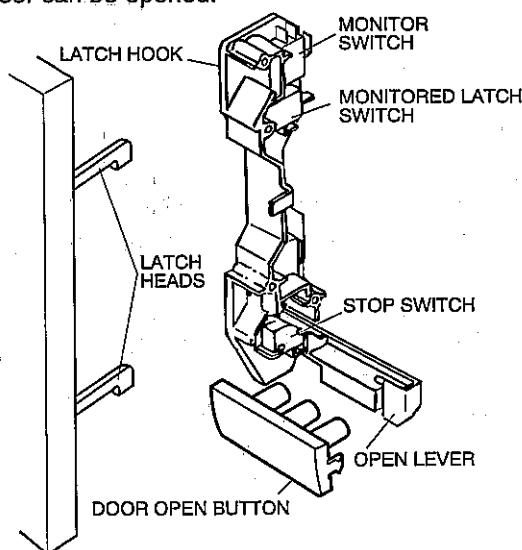

Figure D-1. Door Open Mechanism

MONITORED LATCH SWITCH SW1 AND STOP SWITCH SW3

- When the oven door is closed, the contacts COM-NO of each switch must be closed.
- When the oven door is opened, the contacts COM-NO of each switch must be opened.

MONITOR SWITCH SW2

The monitor switch is activated (the contacts opened) by the upper latch head on the door while the door is closed. The switch is intended to render the oven inoperative by means of blowing the fuse F2 F8A when the contacts of the moni-

tored latch switch SW1 fail to open when the door is opened.

Function

- When the door is opened, the contacts (COM-NC) of monitor switch SW2 close (to the ON condition) due to their being normally closed and contacts (COM-NO) open. At this time the monitored latch switch SW1 is in the OFF condition (contacts open) due to their being normally open contact switches.
- As the door goes to a closed position, the monitor switch SW2 contacts (COM-NC) are opened and contacts (COM-NO) closed and then the monitored latch switch and stop switch contacts close. (On opening the door, each of these switches operate inversely.)
- If the door is opened and the monitored latch switch SW1 contacts fail to open, the fuse F2 (F8A) blows immediately after closing of the monitor switch (COM-NC) contacts.

CAUTION: BEFORE REPLACING A BLOWN FUSE F2 F8A TEST THE MONITORED LATCH SWITCH, MONITOR SWITCH FOR PROPER OPERATION.
(REFER TO CHAPTER "TEST PROCEDURE").

FUSE F1 15A 250V

If the wire harness or electrical components are short-circuited, this fuse F1 15A 250V blows to prevent an electric shock or fire hazard.

FUSE F2 F8A 250V

- If the wire harness or electrical components are short-circuited, this fuse blows to prevent an electric shock or fire hazard.
- The fuse also blows when monitored latch switch SW1 remains closed with the oven door open and when the monitor switch SW2 contact (COM-NC) closes.
- The fuse also blows when the asymmetric rectifier, H.V. rectifier, H.V. wire harness, H.V. capacitor, magnetron or secondary winding of high voltage transformer is shorted

TC TRANSFORMER

TC transformer converts A.C. line voltage into low voltage to drive the control unit.

THERMAL CUT-OUT TC1 150°C (OVEN)

The thermal cut out protects the oven against overheat during grill cooking, convection cooking or dual (combination) cooking. If the temperature rises above 150°C because the fan motor is interrupted, the air inlet duct is blocked or the ventilation openings are obstructed, the thermal cut-out opens and switches off the all electrical parts.

When the oven cools itself down to the operating temperature of 130°C, the contacts of the thermal cut-out will close again.

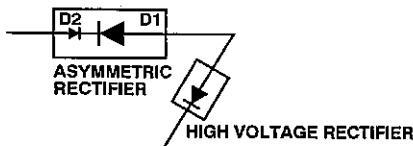

THERMAL CUT-OUT TC2 125°C (MG)

This thermal cut-out protects the magnetron against overheat. If the temperature goes up higher than 125°C because the fan motor is interrupted or the ventilation openings are blocked, the thermal cut-out TC2 will open and line voltage to the high voltage transformer I will cut off and operation of the magnetron MG will be stopped. The defective thermal cut-out must be replaced with a new one.

FUNCTION OF IMPORTANT COMPONENTS

ASYMMETRIC RECTIFIER

The asymmetric rectifier is solid state device that prevents current flow in both directions. And it prevents the temperature rise of the power transformer by blowing the fuse F2 F8A when the high voltage rectifier is shorted.

The rated peak reverse voltage of D1 of the asymmetric rectifier is 6 KV. The rated peak reverse voltage of D2 of the asymmetric rectifier is 1.7 KV. D1 and D2 of the asymmetric rectifier or high voltage rectifier are shorted when the each peak reverse voltage goes beyond the each rated peak reverse voltage. (The process of the blowing the fuse F2 F8A.)

1. The high voltage rectifier is shorted by any causes when microwave cooking or dual cooking.
2. The peak reverse voltage of D2 of the rectifier goes beyond the rated peak reverse voltage 1.7 KV in the voltage doubler circuit.
3. D2 of the rectifier is shorted.
4. The large electric currents flow through the high voltage winding of the high voltage transformer.
5. The large electric currents beyond 8A flow through the primary winding of the high voltage transformer.
6. The fuse F2 F8A blows by the large electric currents.
7. The power supplying to the high voltage transformer is cut off.

NOISE FILTER

The noise filter assembly prevents radio frequency interference that might flow back in the power circuit.

TURNTABLE MOTOR TTM

The turntable motor drives the roller stay to rotate the turntable.

FAN MOTOR FM

The fan motor drives a blade which draws external cool air. This cool air is directed through the air vanes surrounding the magnetron and cools the magnetron. This air is channeled through the oven cavity to remove steam and vapours given off from the heating foods. It is then exhausted through the exhausting air vents at the oven cavity.

CONVECTION MOTOR CM

The convection motor drives the convection fan and provide the heated air.

TOP GRILL HEATING ELEMENT GH

The grill heating element is provided to brown the food and is located on the top of the oven cavity.

BOTTOM GRILL HEATING ELEMENT BH

The grill heating element is provided to brown the food and is located at the base of the oven cavity.

CONVECTION COOKING SYSTEM

This oven is designed with a hot air heating system where food is heated by forced circulation of the hot air produced by the grill heaters.

The air heated by the grill heaters is circulated through the convection passage provided on the outer casing of the oven cavity by means of the convection fan which is driven by the convection motor. It is then circulated inside the oven through the vent holes provided on the back side of the oven. Next, the hot air heats the food on the turntable and leaves the oven cavity through the vent in the oven cavity rear wall.

In this way, the hot air circulates inside the oven cavity to raise its temperature and, at the same time, comes into contact with the food being cooked.

When the temperature inside the oven cavity reaches the selected temperature, the heating elements are de-energized. When the temperature inside the oven cavity drops below the selected temperature, the heating elements are energized again. In this way, the inside of the oven cavity is maintained at approximately the selected temperature.

When the convection time reaches "0", the heating elements are de-energized and the convection fan stops operating and the oven shuts off. At the high temperature (more than 104°C), the fan motor remains rotating. Automatically the fan motor will be shut down at low temperature (less than 104°C).

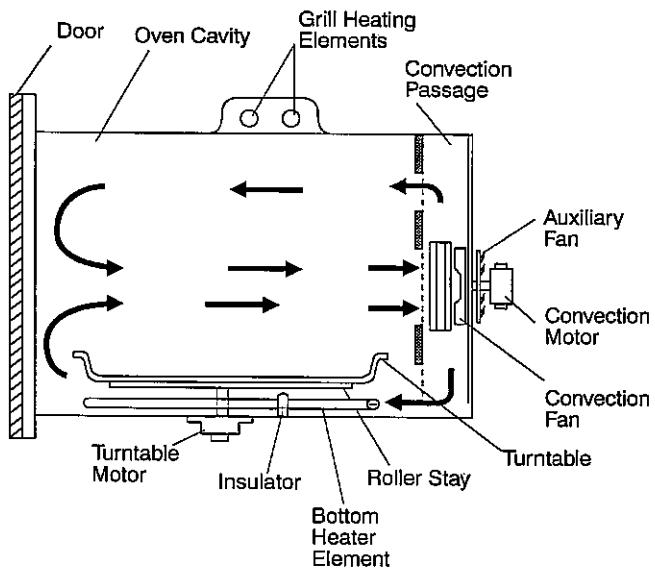

Figure D-2. Convection Cooking System

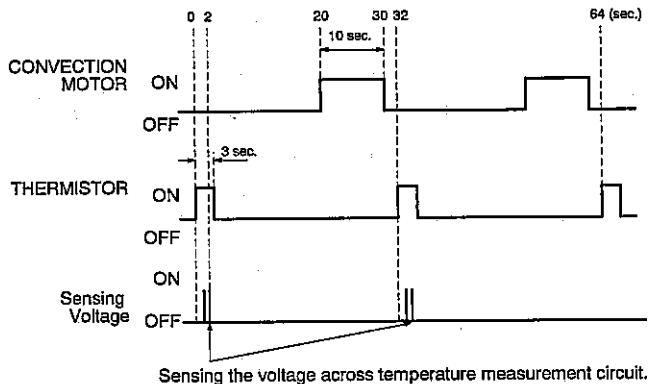

FUNCTION OF IMPORTANT COMPONENTS

SENSING FIRE OPERATION

The oven will stop its operation when there is a fire in the oven cavity in microwave cooking condition.

LSI measures the voltage across the temperature measurement circuit intermittently within a 32-second time base after since the oven is started in microwave cooking condition. The oven will stop its operation when the difference of the voltages is more than 0.69 volts in microwave cooking condition.

1. Within a 32-second base, first the thermistor is energized for 3 seconds. After 2 seconds since the thermistor is energized, the voltage across the temperature measurement circuit is measured. And after 21 seconds since the thermistor is cut off, the convection motor operates for 10 seconds.
2. The oven carries out the procedure above again. If the second voltage is 0.69V higher than the first voltage, LSI judges it is a fire in the oven cavity and stops the oven.
3. When sensor cooking, the sensing fire operation is not carried out until the oven senses the steam from food. Because food cannot be cooked well by rotating the convection fan at that time. After sensing the steam, the sensing fire operation is started.
4. When LSI judges it is fire in the oven cavity, LSI will switch off the relays to the power transformer, fan motor and convection motor and LSI stops counting down. And then the damper is closed so that the fresh air does not come into the oven cavity.

Sensing the voltage across temperature measurement circuit.

TEST PROCEDURES

| PROCEDURE LETTER | COMPONENT TEST |
|------------------|----------------|
|------------------|----------------|

A MAGNETRON TEST

NEVER TOUCH ANY PART IN THE CIRCUIT WITH YOUR HAND OR AN INSULATED TOOL WHILE THE OVEN IS IN OPERATION.

CARRY OUT 3D CHECK

Isolate the magnetron from high voltage circuit by removing all leads connected to filament terminal.

To test for an open circuit filament use an ohmmeter to make a continuity test between the magnetron filament terminals, the meter should show a reading of less than 1 ohm.

To test for short filament to anode condition, connect ohmmeter between one of the filament terminals and the case of the magnetron (ground). This test should be indicated an infinite resistance. If a low or zero resistance reading is obtained then the magnetron should be replaced.

MICROWAVE OUTPUT POWER (IEC-705-1988)

The following test procedure should be carried out with the microwave oven in a fully assembled condition (outer case fitted). Microwave output power from the magnetron can be measured by way of IEC 705, i.e. it can be measured by using water load how much it can be absorbed by the water load. To measure the microwave output power in the microwave oven, the relation of calorie and watt is used. When $P(W)$ heating works for t (second), approximately $P \times t/4.187$ calorie is generated. On the other hand, if the temperature of the water with $V(ml)$ rises ΔT ($^{\circ}C$) during this microwave heating period, the calorie of the water is $V \times \Delta T$.

The formula is as follows;

$$P \times t / 4.187 = V \times \Delta T \quad P (W) = 4.187 \times V \times \Delta T / t$$

Our condition for water load is as follows:

Room temperature.....around $20^{\circ}C$ Power supply Voltage.....Rated voltage

Water load.....1000 g Initial temperature..... $10 \pm 2^{\circ}C$ Heating time.....47 sec.

$$P=90 \times \Delta T$$

Measuring condition:

1. Container

The water container must be a cylindrical borosilicate glass vessel having a maximum material thickness of 3 mm and an outside diameter of approximately 190 mm.

2. Temperature of the oven and vessel

The oven and the empty vessel are at ambient temperature prior to the start the test.

3. Temperature of the water

The initial temperature of the water is $(10 \pm 2)^{\circ}C$.

4. Select the initial and final water temperature so that the maximum difference between the final water temperature and the ambient temperature is 5K.

5. Select stirring devices and measuring instruments in order to minimize addition or removal of heat.

6. The graduation of the thermometer must be scaled by $0.1^{\circ}C$ at minimum and accurate thermometer.

7. The water load must be (1000 ± 5) g.

8. "t" is measured while the microwave generator is operating at full power. Magnetron filament heat-up time is not included.

NOTE: The operation time of the microwave oven is "t + 3" sec. 3 sec. is magnetron filament heat-up time.

Measuring method:

1. Measure the initial temperature of the water before the water is added to the vessel.

(Example: The initial temperature $T_1 = 11^{\circ}C$)

2. Add the 1 litre water to the vessel.

3. Place the load on the centre of the shelf.

4. Operate the microwave oven at HIGH for the temperature of the water rises by a value ΔT of (10 ± 2) K.

5. Stir the water to equalize temperature throughout the vessel.

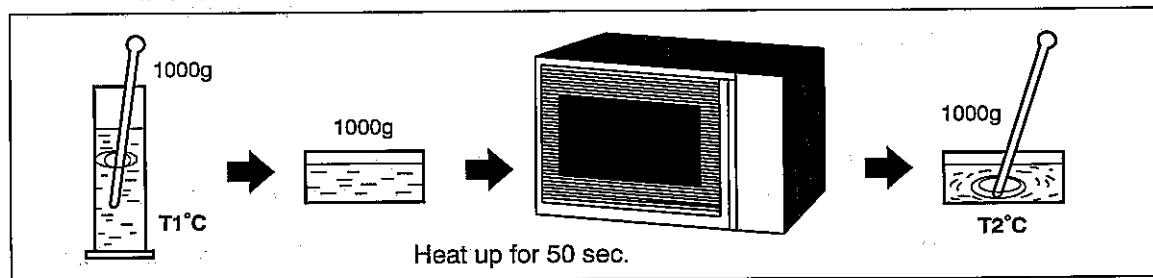

TEST PROCEDURES

6. Measure the final water temperature. (Example: The final temperature $T_2 = 21^\circ\text{C}$)
7. Calculate the microwave power output P in watts from above formula.

| | |
|--|--|
| Initial temperature | $T_1 = 11^\circ\text{C}$ |
| Temperature after $(47 + 3) = 50$ sec. | $T_2 = 21^\circ\text{C}$ |
| Temperature difference Cold-Warm..... | $\Delta T = 10^\circ\text{C}$ |
| Measured output power | |
| The equation is " $P = 90 \times \Delta T$ " | $P = 90 \times 10^\circ\text{C} = 900$ Watts |

JUDGMENT: The measured output power should be at least $\pm 15\%$ of the rated output power.

CAUTION: 1°C CORRESPONDS TO 100 WATTS. REPEAT MEASUREMENT IF THE POWER IS INSUFFICIENT.

B

HIGH VOLTAGE TRANSFORMER TEST

WARNING: High voltages and large currents are present at the secondary winding and filament winding transformer. It is very dangerous to work near this part when the oven is on. NEVER make any voltage measurements of the high-voltage circuits, including the magnetron filament.

CARRY OUT 3D CHECKS

Disconnect the leads to the primary winding of the high voltage transformer. Disconnect the filament and secondary winding connections from the rest of the HV circuitry. Using an ohmmeter, set on a low range, it is possible to check the continuity of all three windings. The following readings should be obtained:

| | |
|----------------------|------------------------|
| a. Primary winding | 2.4 ohms approximately |
| b. Secondary winding | 99 ohms approximately |
| c. Filament winding | less than 1 ohm |

If the reading obtained are not stated above, then the high voltage transformer is probably faulty and should be replaced.

CARRY OUT 4R CHECKS

C

HIGH VOLTAGE RECTIFIER ASSEMBLY TEST

HIGH VOLTAGE RECTIFIER TEST

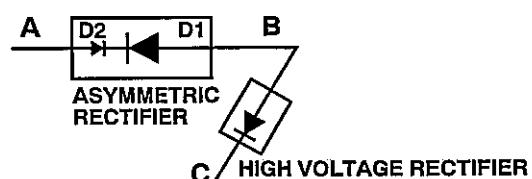

CARRY OUT 3D CHECKS.

Isolate the high voltage rectifier assembly from the HV circuit. The high voltage rectifier can be tested using an ohmmeter set to its highest range. Connect the ohmmeter across the terminal B+C of the high voltage rectifier and note the reading obtained. Reverse the meter leads and note this second reading. The normal resistance is infinite in one direction and more than $100\text{ k}\Omega$ in the other direction.

CARRY OUT 4R CHECKS

ASYMMETRIC RECTIFIER TEST

CARRY OUT 3D CHECKS.

TEST PROCEDURES

Isolate the high voltage rectifier assembly from the HV circuit. The asymmetric can be tested using an ohmmeter set to its highest range across the terminals A+B of the asymmetric rectifier and note the reading obtained. Reverse the meter leads and note this second reading. If an open circuit is indicated in both direction then the asymmetric rectifier is good. If an asymmetric rectifier is shorted in either direction, then the asymmetric rectifier is probably faulty and must be replaced with high voltage rectifier. When the asymmetric rectifier is defective, check whether magnetron, high voltage rectifier, high voltage wire or filament winding of the power transformer is shorted.

CARRY OUT 4R CHECKS

NOTE: FOR MEASUREMENT OF THE RESISTANCE OF THE RECTIFIER, THE BATTERIES OF THE MEASURING INSTRUMENT MUST HAVE A VOLTAGE AT LEAST 6 VOLTS, BECAUSE OTHERWISE AN INFINITE RESISTANCE MIGHT BE SHOWN IN BOTH DIRECTIONS.

D HIGH VOLTAGE CAPACITOR TEST

CARRY OUT 3D CHECKS

- A. Isolate the high voltage capacitor from the circuit.
- B. Continuity check must be carried out with measuring instrument which is set to the highest resistance range.
- C. A normal capacitor shows continuity for a short time (kick) and then a resistance of about $10M\Omega$ after it has been charged.
- D. A short-circuited capacitor shows continuity all the time.
- E. An open capacitor constantly shows a resistance about $10 M\Omega$ because of its internal $10M\Omega$ resistance.
- F. When the internal wire is opened in the high voltage capacitor shows an infinite resistance.
- G. The resistance across all the terminals and the chassis must be infinite when the capacitor is normal. If incorrect reading are obtained, the high voltage capacitor must be replaced.

CARRY OUT 4R CHECKS

E SWITCH TEST

CARRY OUT 3D CHECKS

Isolate the switch to be tested and using an ohmmeter check between the terminals as described in the following table.

Table: Terminal Connection of Switch

| Plunger Operation | COM to NO | COM to NC |
|-------------------|-----------|-----------|
| Released | O.C. | S.C. |
| Depressed | S.C. | O.C. |

COM; Common terminal, NO; Normally open terminal NC; Normally close terminal
S.C.; Short, O.C.; Open circuit

If incorrect readings are obtained, make the necessary switch or replace the switch.

CARRY OUT 4R CHECKS.

TEST PROCEDURES

G

THERMAL CUT-OUT TEST

CARRY OUT 3D CHECKS

Disconnect the leads from the terminals of the thermal cut-out. Then using an ohmmeter, make a continuity test across the two terminals as described in the below.

CARRY OUT 4R CHECKS

Table: Thermal Cut-out Test

| Parts Name | Temperature of "ON" condition (closed circuit). (°C) | Temperature of "OFF" condition (open circuit). (°C) | Indication of ohmmeter (When room temperature is approx. 20°C.) |
|---------------------------|--|---|---|
| Thermal cut-out 150°C TC1 | Below 130°C | Above 150°C | Closed circuit |
| Thermal cut-out 125°C TC2 | This is not resetable type | Above 125°C | Closed circuit |

If incorrect readings are obtained, replace the thermal cut-out.

An open circuit thermal cut-out (MG) TC2 indicates that the magnetron has overheated, this may be due to restricted ventilation, cooling fan failure.

An open circuit thermal cut-out (OVEN) TC1 indicates that the oven cavity has overheated, this may be due to no load operation.

H

MOTOR WINDING TEST

CARRY OUT 3D CHECKS

Disconnect the leads from the motor. Using an ohmmeter, check the resistance between the two terminals as described in the table below.

Table: Resistance of Motor

| Motors | Resistance |
|----------------------|---------------------|
| Fan motor | Approximately 216 Ω |
| Turntable motor | Approximately 16 kΩ |
| Convection fan motor | Approximately 410 Ω |

If incorrect readings are obtained, replace the motor.

CARRY OUT 4R CHECKS

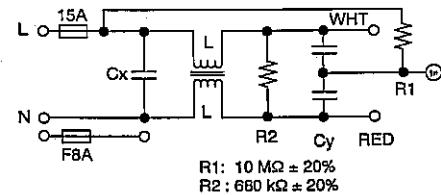

I

NOISE FILTER TEST

CARRY OUT 3D CHECKS

Disconnect the leads from the terminals of noise filter.

Using an ohmmeter, check between the terminals as described in the following table.

| L (min) | Cx ± 20% | Cy ± 20% |
|---------|----------|----------|
| 1.0mH | 0.22μF | 4700pF |

| MEASURING POINTS | INDICATION OF OHMMETER |
|------------------------------|------------------------|
| Between N and L | Approx. 680 kΩ |
| Between terminal N and WHITE | Short circuit |
| Between terminal L and RED | Short circuit |

If incorrect readings are absorbed, replace the noise filter unit.

CARRY OUT 4R CHECKS

TEST PROCEDURES

O

RELAY TEST

CARRY OUT 3D CHECKS.

Remove the outer case and check voltage between Pin Nos. 1 and 3 of the 4 pin connector (E) on the control unit with an A.C. voltmeter.

The meter should indicate 230 volts, if not check oven circuit.

Relay Test

Check voltage at the relay coil with a D.C. voltmeter during the microwave cooking operation, convection cooking operation or grill operation.

DC. voltage indicated Defective relay.

DC. voltage not indicated..... Check diode which is connected to the relay coil. If diode is good, control unit is defective.

| RELAY SYMBOL | OPERATIONAL VOLTAGE | CONNECTED COMPONENTS |
|--------------|---------------------|-----------------------------------|
| RY1 | Approx. 18.0V D.C. | Oven lamp / Turntable motor |
| RY2 | Approx. 18.0V D.C. | High voltage transformer |
| RY3 | Approx. 24.0V D.C. | Grill heating element (Top grill) |
| RY4 | Approx. 24.0V D.C. | Bottom heating element |
| RY5 | Approx. 24.0V D.C. | Fan motor |
| RY6 | Approx. 24.0V D.C. | Convection fan motor |

CARRY OUT 4R CHECKS.

P

PROCEDURES TO BE TAKEN WHEN THE FOIL PATTERN ON THE PRINTED WIRING BOARD (PWB) IS OPEN.

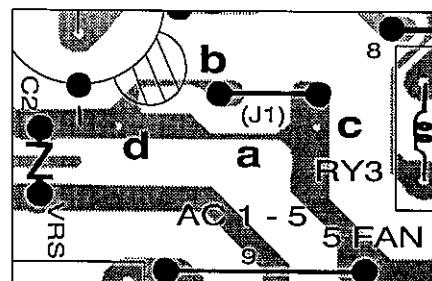

To protect the electronic circuits, this model is provided with a fine foil pattern added to the input circuit on the PWB, this foil pattern acts as a fuse. If the foil pattern is open, follow the troubleshooting guide given below for repair.

Problem: POWER ON, indicator does not light up.

CARRY OUT 3D CHECKS.

| STEPS | OCCURANCE | CAUSE OR CORRECTION |
|-------|--|---|
| 1 | The rated AC voltage is not present at Power terminal of CPU connector (CN-A). | Check supply voltage and oven power cord. |
| 2 | The rated AC voltage is present at primary side of low voltage transformer. | Low voltage transformer or secondary circuit defective. Check and repair. |
| 3 | Only pattern at "a" is broken. | *Insert jumper wire J1 and solder. (CARRY OUT <u>3D</u> CHECKS BEFORE REPAIR) |
| 4 | Pattern at "a" and "b" are broken. | *Insert the coil RCILF2003YAZZ between "c" and "d". (CARRY OUT <u>3D</u> CHECKS BEFORE REPAIR) |

NOTE: *At the time of these repairs, make a visual inspection of the varistor for burning damage and examine the transformer with tester for the presence of layer short circuit (check primary coil resistance). If any abnormal condition is detected, replace the defective parts.

CARRY OUT 4R CHECKS.

TOUCH CONTROL

TOUCH CONTROL PANEL ASSEMBLY

OUTLINE OF TOUCH CONTROL PANEL

The touch control section consists of the following units as shown in the touch control panel circuit.

- (1) Key Unit
- (2) Control Unit (The Control unit consists of Power unit and CPU unit.)

The principal functions of these units and signals communicated among them are explained below.

Key Unit

The key unit is composed of a matrix, signals generated in the LSI are sent to the key and jog unit from P40, P41, P77 and P76. When a key pad is touched, a signal is completed through the key unit and passed back to the LSI through P47 - P44 to perform the function that was requested.

Control Unit

Control unit consists of LSI, power source circuit, synchronizing signal circuit, ACL circuit, buzzer circuit, temperature measurement circuit, indicator circuit, encoder circuit, potentiometer circuit and back light circuit.

1) LSI

This LSI controls the key strobe signal, relay driving signal for oven function and indicator signal.

2) Power Source Circuit

This circuit generates voltage necessary in the control unit.

| Symbol | Voltage | Application |
|--------|---------|-------------|
| VC | -5.2V | LSI(IC1) |

3) Synchronizing Signal Circuit

The power source synchronizing signal is available in order to compose a basic standard time in the clock circuit. It accompanies a very small error because it works on commercial frequency.

4) ACL

A circuit to generate a signals which resets the LSI to the initial state when power is supplied.

5) Buzzer Circuit

The buzzer is responsive to signals from the LSI to emit audible sounds (tact switch touch sound and completion sound).

6) Door Sensing Switch (Stop Switch)

A switch to "tell" the LSI if the door is open or closed.

7) Relay Circuit

To drive the magnetron, top and bottom heating elements, fan motor, convection motor, turntable motor and light the oven lamp.

8) Encoder

The encoder converts the signal generated by LSI into the pulse signal, and the pulse signal is returned to the LSI.

9) Potentiometer Circuit

The circuit makes setting of the cooking mode by variable resistance.

10) Temperature Measurement Circuit : (OVEN THERMISTOR)

The temperature in the oven cavity is sensed by the thermistor. The variation of resistance according to sensed temperature is detected by the temperature measurement circuit and the result applied to LSI. The LSI uses this information to control the relay and display units.

11) Back Light Circuit

A circuit to drive the back light (Light emitting diodes LD1 - LD10).

12) Indicator Circuit

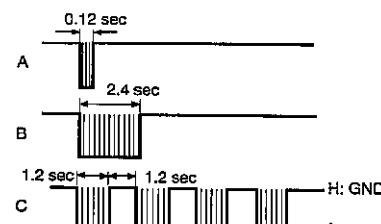

This circuit consists of 7-digits, 39-segments and 3-common electrodes using a Liquid Crystal Display.

DESCRIPTION OF LSI

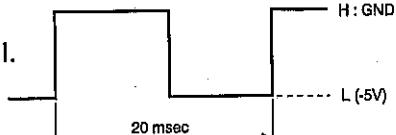

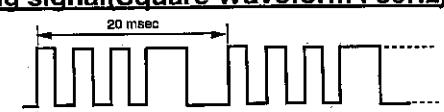

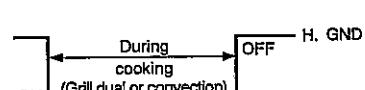

DESCRIPTION OF LSI

LSI(IZA900DR)

The I/O signal of the LSI(IZA900DR) are detailed in the following table.

| Pin No. | Signal | I/O | Description |
|---------|---------|--------|--|
| 1 | C1 | IN | Terminal not used. |
| 2 | VL1 | IN | Power source voltage input terminal. Standard voltage for LCD. |
| 3-5 | AN7-AN5 | IN | Heating constant compensation terminal. |
| 6 | AN4 | IN | Signal coming from potentiometer. By inputting DC voltage corresponding to the cooking mode set by the potentiometer, this input is converted into the cooking mode by the A/D converter built into the LSI. |
| 7 | AN3 | IN | Temperature measurement input: OVEN THERMISTOR. By inputting DC voltage corresponding to the temperature detected by the thermistor, this input is converted into temperature by the A/D converter built into the LSI. |
| 8 | AN2 | IN | Input signal which communicates the door open/close information to LSI. Door closed; "H" level signal. Door opened; "L" level signal. |
| 9-10 | AN1-AN0 | IN | Terminal not used. |
| 11 | P57 | OUT | Timing signal output terminal for temperature measurement (oven). "H" level (GND) : Thermistor OPEN timing. "L" level (-5V) : Temperature measuring timing. |
| 12 | P56 | OUT | Signal to sound buzzer. A: key touch sound. B: Completion sound. C: When the temperature of the oven cavity reaches the preset temperature in the preheating mode, or when the preheating hold time (30 minutes) is elapsed. |
| | | |  |
| 13 | P55 | OUT | Signal similar to P57. Timing signal output terminal for temperature measurement. |
| 14-18 | P54-P50 | IN/OUT | Terminal not used. |
| 19 | P47 | IN | Signal coming from touch tact switch. When any one of J-8 line tact switches on key and jog unit matrix is touched, a corresponding signal from P40, P41, P76 and P77 will be input into P47. When no tact switch is touched, the signal is held at "L" level. |
| 20 | P46 | IN | Signal similar to P47. When any one of J-7 line tact switches on key and jog unit matrix is touched, a corresponding signal will be input into P46. |
| 21 | P45 | IN | Signal similar to P47. When any one of J-4 line tact switches on key and jog unit matrix is touched, a corresponding signal will be input into P45. |
| 22 | P44 | IN | Signal similar to P47. When any one of J-3 line tact switches on key and jog unit matrix is touched, a corresponding signal will be input into P44. |
| 23 | INT1 | IN | Signal coming from encoder. When the encoder is turned, the contacts of encoder make pulse signals. And pulse signals are input into INT1. |

DESCRIPTION OF LSI

| Pin No. | Signal | I/O | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|---------|--------|---|------------|----|-----|------|--------|-------|-----|--------|-------|-----|--------|--------|-----|--------|--------|-----|-------|--------|------------|----|-----|------|--------|-------|-----|--------|--------|-----|--------|--------|-----|--------|--------|-----|-------|--------|
| 24 | INT0 | IN | <p>Signal to synchronized LSI with commercial power source frequency(50Hz).</p> <p>This is basic timing for time processing of LSI.</p>  | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 25 | P41 | OUT | <p>Tact switch strobe signal.</p> <p>Signal applied to tact switch section. A pulse signal is input to P44 - P47 terminal while one of J-6 line tact switches on matrix is touched.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 26 | P40 | OUT | <p>Tact switch strobe signal.</p> <p>Signal applied to tact switch section. A pulse signal is input to P44 - P47 terminal while one of J-5 line tact switches on matrix is touched.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 27 | P77 | OUT | <p>Tact switch strobe signal.</p> <p>Signal applied to tact switch section. A pulse signal is input to P44 - P47 terminal while one of J-2 line tact switches on matrix is touched.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 28 | P76 | OUT | <p>Tact switch strobe signal.</p> <p>Signal applied to tact switch section. A pulse signal is input to P44 - P47 terminal while one of J-1 line tact switches on matrix is touched.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 29-32 | P75-P72 | IN | Terminal not used. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 33 | P71 | OUT | <p>Oven lamp and turntable motor driving signal(Square Waveform : 50Hz).</p> <p>To turn on and off shut-off relay (RY1). The square waveform voltage is delivered to the relay (RY1) driving circuit.</p>  | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 34 | P70 | IN | Connected to VC. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 35 | RESET | IN | <p>Auto clear terminal.</p> <p>Signal is input to reset the LSI to the initial state when power is applied. Temporarily set to "L" level the moment power is applied, at this time the LSI is reset. Thereafter set at "H" level.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 36 | P81 | OUT | <p>Magnetron high-voltage circuit driving signal.</p> <p>To turn on and off the cook relay (RY2). In 100% POWER operation, the signals hold "L" level during microwave cooking and "H" level while not cooking. In other cooking modes (70%, 50%, 30%, 10%) the signal turns to "H" level and "L" level in repetition according to the power level.</p> <table border="1"> <caption>ON/OFF time ratio in Micro cooking (a. 32second time base)</caption> <tr> <th>MICRO COOK</th> <th>ON</th> <th>OFF</th> </tr> <tr> <td>100%</td> <td>32sec.</td> <td>0sec.</td> </tr> <tr> <td>70%</td> <td>24sec.</td> <td>8sec.</td> </tr> <tr> <td>50%</td> <td>18sec.</td> <td>14sec.</td> </tr> <tr> <td>30%</td> <td>12sec.</td> <td>20sec.</td> </tr> <tr> <td>10%</td> <td>6sec.</td> <td>26sec.</td> </tr> </table> <table border="1"> <caption>ON/OFF time ratio in Micro cooking (a. 48second time base)</caption> <tr> <th>MICRO COOK</th> <th>ON</th> <th>OFF</th> </tr> <tr> <td>100%</td> <td>48sec.</td> <td>0sec.</td> </tr> <tr> <td>70%</td> <td>36sec.</td> <td>12sec.</td> </tr> <tr> <td>50%</td> <td>26sec.</td> <td>22sec.</td> </tr> <tr> <td>30%</td> <td>16sec.</td> <td>32sec.</td> </tr> <tr> <td>10%</td> <td>8sec.</td> <td>40sec.</td> </tr> </table> | MICRO COOK | ON | OFF | 100% | 32sec. | 0sec. | 70% | 24sec. | 8sec. | 50% | 18sec. | 14sec. | 30% | 12sec. | 20sec. | 10% | 6sec. | 26sec. | MICRO COOK | ON | OFF | 100% | 48sec. | 0sec. | 70% | 36sec. | 12sec. | 50% | 26sec. | 22sec. | 30% | 16sec. | 32sec. | 10% | 8sec. | 40sec. |

DESCRIPTION OF LSI

| Pin No. | Signal | I/O | Description |
|---------|---------|-----|--|
| 92 | VREF | IN | Connected to GND. |
| 93 | AVSS | IN | Connected to VC. |
| 94 | COM3 | OUT | Common data signal. Connected to LCD (Pin No. 36). No connection in LCD. |
| 95 | COM2 | OUT | Common data signal: COM3. Connected to LCD (Pin No. 35). |
| 96 | COM1 | OUT | Common data signal: COM2. Connected to LCD (Pin No. 34). |
| 97 | COM0 | OUT | Common data signal: COM1. Connected to LCD (Pin No. 33). |
| 98-99 | VL3-VL2 | IN | Power source voltage input terminal. Standard voltage for LCD. |
| 100 | C2 | IN | Terminal not used. |

SERVICING

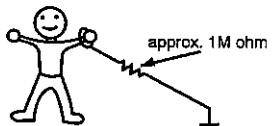

SERVICING

1. Precautions for Handling Electronic Components

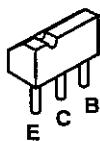

This unit uses CMOS LSI in the integral part of the circuits. When handling these parts, the following precautions should be strictly followed. CMOS LSI have extremely high impedance at its input and output terminals. For this reason, it is easily influenced by the surrounding high voltage power source, static electricity charge in clothes, etc., and sometimes it is not fully protected by the built-in protection circuit.

In order to protect CMOS LSI.

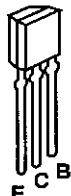

- 1) When storing and transporting, thoroughly wrap them in aluminium foil. Also wrap PW boards containing them in aluminium foil.
- 2) When soldering, ground the technician as shown in the figure and use grounded soldering iron and work table.

2. Shapes of Electronic Components

Transistor
2SB1238

Transistor
KRC243M

3. Servicing of Touch Control Panel

We describe the procedures to permit servicing of the touch control panel of the microwave oven and the precautions you must take when doing so.

To perform the servicing, power to the touch control panel is available either from the power line of the oven itself or from an external power source.

(1) Servicing the touch control panel with power supply of the oven :

CAUTION:

THE HIGH VOLTAGE TRANSFORMER OF THE MICROWAVE OVEN IS STILL LIVE DURING SERVICING AND PRESENTS A HAZARD .

Therefore, when checking the performance of the touch control panel, put the outer cabinet on the oven to avoid touching the high voltage transformer, or unplug the primary terminal (connector) of the high voltage transformer to turn it off; the end of such connector must be insulated with an insulating tape. After servicing, be sure to replace the leads to their original locations.

- A. On some models, the power supply cord between the touch control panel and the oven itself is so short that the two can't be separated.

For those models, check and repair all the controls

(sensor-related ones included) of the touch control panel while keeping it connected to the oven.

- B. On some models, the power supply cord between the touch control panel and the oven proper is so long enough that they may be separated from each other. For those models, therefore, it is possible to check and repair the controls of the touch control panel while keeping it apart from the oven proper; in this case you must short both ends of the door sensing switch (on PWB) of the touch control panel with a jumper, which brings about an operational state that is equivalent to the oven door being closed. As for the sensor-related controls of the touch control panel, checking them is possible if the dummy resistor(s) with resistance equal to that of the controls are used.

(2) Servicing the touch control panel with power supply from an external power source:

Disconnect the touch control panel completely from the oven proper, and short both ends of the door sensing switch (on PWB) of the touch control panel, which brings about an operational state that is equivalent to the oven door being closed. Connect an external power source to the power input terminal of the touch control panel, then it is possible to check and repair the controls of the touch control panel; it is also possible to check the sensor-related controls of the touch control panel by using the dummy resistor(s).

4. Servicing Tools

Tools required to service the touch control panel assembly.

- 1) Soldering iron: 30W
(It is recommended to use a soldering iron with a grounding terminal.)
- 2) Oscilloscope: Single beam, frequency range: DC - 10MHz type or more advanced model.
- 3) Others: Hand tools

5. Other Precautions

- 1) Before turning on the power source of the control unit, remove the aluminium foil applied for preventing static electricity.
- 2) Connect the connector of the key unit to the control unit being sure that the lead wires are not twisted.
- 3) After aluminium foil is removed, be careful that abnormal voltage due to static electricity etc. is not applied to the input or output terminals.
- 4) Attach connectors, electrolytic capacitors, etc. to PWB, making sure that all connections are tight.
- 5) Be sure to use specified components where high precision is required.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

WARNING: Avoid possible exposure to microwave energy. Please follow the instructions below before operating the oven.

1. CARRY OUT 3D CHECKS.
2. Make sure that a definite "click" can be heard when the microwave oven door is unlatched. (Hold the door in a closed position with one hand, then push the door open button with the other, this causes the latch leads to rise, it is then possible to hear a "click" as the door switches operate.)
3. Visually check the door and cavity face plate for damage (dents, cracks, signs of arcing etc.).
1. Door does not close firmly.
2. Door hinge, support or latch hook is damaged.
3. The door gasket or seal is damaged.
4. The door is bent or warped.
5. There are defective parts in the door interlock system.
6. There are defective parts in the microwave generating and transmission assembly.
7. There is visible damage to the oven.

Carry out any remedial work that is necessary before operating the oven.

Do not operate the oven if any of the following conditions exist;

Please refer to 'OVEN PARTS, CABINET PARTS, DOOR PARTS', when carrying out any of the following removal procedures:

OUTER CASE REMOVAL

To remove the outer case proceed as follows.

1. Disconnect oven from power supply.
2. Open the oven door and wedge it open.
3. Remove backplate.
4. Remove the screws from rear and along the side edge of case.
5. Slide the entire case back about 3cm to free it from retaining clips on the cavity face plate.

6. Lift the entire case from the oven.
7. Discharge the H.V. capacitor before carrying out any further work.
8. Do not operate the oven with the outer case removed.

N.B.: Step 1, 2 and 6 form the basis of the 3D checks.
CAUTION: DISCHARGE HIGH VOLTAGE CAPACITOR BEFORE TOUCHING ANY OVEN COMPONENT OR WIRING.

HIGH VOLTAGE COMPONENTS REMOVAL (HIGH VOLTAGE CAPACITOR AND HIGH VOLTAGE RECTIFIER ASSEMBLY)

To remove the components, proceed as follows.

1. CARRY OUT 3D CHECKS
2. Disconnect all the leads and terminals of high voltage rectifier assembly from the high voltage capacitor.
3. Remove one (1) screw holding earth side terminal of high voltage rectifier assembly and remove capacitor holder.
4. Remove one (1) screw holding capacitor holder to oven cavity.
5. Release the capacitor holder from the duct.

6. Remove the capacitor from the capacitor holder.
7. Now high voltage rectifier assembly and capacitor should be free.

CAUTION: WHEN REPLACING HIGH VOLTAGE RECTIFIER ASSEMBLY, ENSURE THAT THE CATHODE (EARTH) CONNECTION IS SECURELY FIXED TO THE CAPACITOR HOLDER WITH AN EARTHING SCREW.

HIGH VOLTAGE TRANSFORMER REMOVAL

1. CARRY OUT 3D CHECKS
2. Disconnect the filament leads of high voltage transformer from high voltage capacitor and the magnetron.
3. Disconnect the H.V. wire A from the high voltage transformer.
4. Disconnect the main wire harness from the high voltage transformer.

5. Remove the two (2) screws and one (1) washer holding the transformer to base plate.
6. Remove the transformer.
7. Now the high voltage transformer is free.

CONTROL PANEL REMOVAL

1. CARRY OUT 3D CHECKS
2. Remove outer wrap.
3. Disconnect wiring panel.
4. Lift up the control panel assembly and pull it forward. Now the control panel assembly is free.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

MAGNETRON REMOVAL

1. CARRY OUT 3D CHECKS.
2. Disconnect the H.V. wire B and filament lead of the transformer from the magnetron.
3. Remove the one (1) screw holding the chassis support to the magnetron.
4. Move the air intake duct to left.
5. Carefully remove four (4) screws holding magnetron to waveguide, when removing the screws hold the magnetron to prevent it from falling.

6. Remove the magnetron from the waveguide with care so the magnetron antenna is not hit by any metal object around the antenna.

CAUTION: WHEN REPLACING THE MAGNETRON, BE SURE THE R.F. GASKET IS IN PLACE AND THE MAGNETRON MOUNTING SCREWS ARE TIGHTENED SECURELY.

FAN MOTOR REPLACEMENT

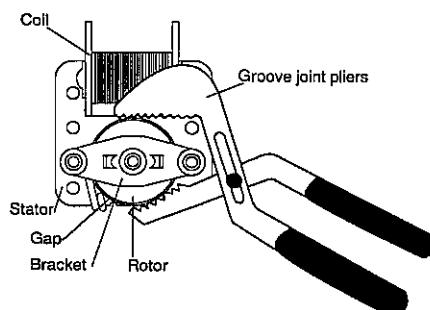

REMOVAL

1. CARRY OUT 3D CHECKS.
2. Remove the one (1) screw holding the noise filter to the chassis support.
3. Release the noise filter from the tabs of the fan duct.
4. Disconnect the wire leads from the fan duct.
5. Remove the one (1) screw holding the capacitor holder to the oven cavity back plate.
6. Release the tabs of the capacitor holder from the fan duct.
7. Remove the one (1) screw holding the fan duct to the oven cavity back plate.
8. Remove the fan duct from the oven.
9. Remove the fan duct from the fan motor shaft according the following procedure.
 - 1) Hold the edge of the rotor of the fan motor by using a pair of groove joint pliers.

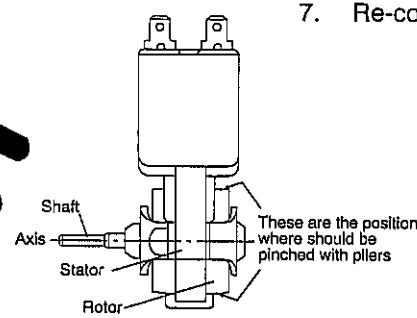

CAUTION:

- Make sure that no swarf from the rotor enters the gap between the rotor & stator of the fan motor.
- Avoid touching the coil of the fan motor with the pliers as the coil may become cut or damaged.
- Avoid deforming the bracket whilst using the pliers.

- 2) Remove the fan blade assembly from the shaft of the fan motor by pulling and rotating the fan blade with your hand.
- 3) Now, the fan blade is free.

Rear view

Side view

CAUTION:

- Do not reuse the removed fan blade as the fixing hole may be oversize.

10. Remove the two (2) screws and nuts holding the fan motor to the fan duct.
11. Now, the fan motor is free.

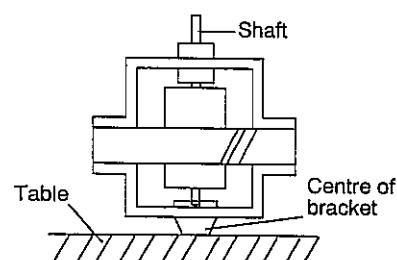

INSTALLATION

1. Install the fan motor to the fan duct with the two (2) screws.
2. Install the fan blade to the fan motor shaft according the following procedure.
 - 1) Hold the centre of the bracket which supports the shaft of the fan motor on the flat table.
 - 2) Apply the screw lock tight into the hole (for shaft) of the fan blade.
 - 3) Install the fan blade to the shaft of fan motor by pushing the fan blade with a small, light weight, ball peen hammer or rubber mallet.

CAUTION:

- Do not hit the fan blade strongly when installed because the bracket may be transformed.
- Make sure that the fan blade rotates smoothly after installed.
- Make sure that the axis of the shaft is not slanted.

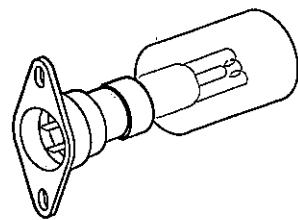

3. Install the fan duct to the oven cavity back plate with the one (1) screw.
4. Insert the tabs of the capacitor holder to the fan duct.
5. Install the capacitor holder to the oven cavity back plate with the one (1) screw.
6. Install the noise filter to the fan duct and the chassis support with the one (1) screw.
7. Re-connect the wire leads to the fan motor.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

OVEN LAMP SOCKET REMOVAL

1. CARRY OUT 3D CHECKS
2. Remove wire leads as positive lock connector removal below.
3. Lift up the oven lamp from its retaining clips.
4. Now, the oven lamp is free.

POSITIVE LOCK® CONNECTOR REMOVAL

1. CARRY OUT 3D CHECKS.
2. Pushing the lever of positive lock® connector.
3. Pull out the positive lock® connector.

CAUTION: WHEN YOU (SERVICE ENGINEERS) CONNECT THE POSITIVE LOCK® CONNECTORS TO THE TERMINALS, CONNECT THE POSITIVE LOCK® SO THAT THE LEVER FACE YOU (SERVICE ENGINEERS).

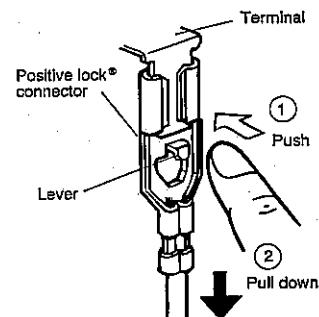

Figure C-2 Positive lock® connector

POWER SUPPLY CORD REPLACEMENT

Removal

1. CARRY OUT 3D CHECKS.
2. Remove the one (1) screw holding the green/yellow wire to the cavity back plate.
3. Disconnect the leads of the power supply cord from the noise filter, referring to the Figure C-4 (a).
4. Release the power supply cord from the rear cabinet.
5. Now, the power supply cord is free.

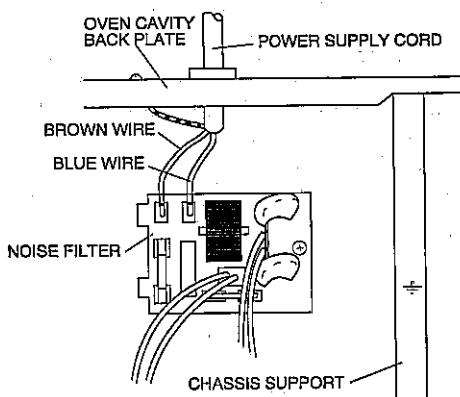

Figure C-4 (a) Replacement of Power Supply Cord

Re-install

1. Insert the moulding cord stopper of power supply cord into the square hole of the rear cabinet, referring to the Figure C-4 (b).
2. Install the earth wire lead of power supply cord to the oven cavity with one (1) screw and tight the screw.
3. Connect the brown and blue wire leads of power supply cord to the noise filter correctly, referring to the Pictorial Diagram.

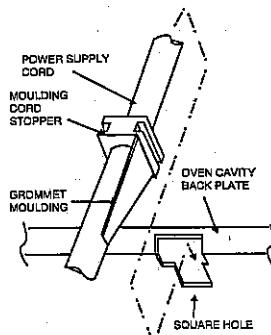

Figure C-4(b). Power Supply Cord Replacement

CONVECTION FAN MOTOR REMOVAL

1. CARRY OUT 3D CHECKS.
2. Remove the two (2) screws holding the back plate to oven cavity.
3. Disconnect the wire leads from the convection motor.
4. Remove the two (2) screws holding the convection fan duct to the oven cavity from out-side.
5. Remove the four (4) screws holding the convection fan duct to the oven cavity.
6. Now the convection fan duct is free.

CONVECTION FAN MOTOR

7. Remove the one (1) nut holding the convection fan, washers, pipe and auxiliary fan to the convection fan motor shaft.
8. Remove the two (2) screws holding the convection motor mounting plate to the convection fan duct.
9. Remove the pin on the convection fan motor shaft.
10. Remove the two (2) screws holding the convection motor mounting plate to the convection fan motor.
11. Now, the convection fan motor is free.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

BOTTOM HEATING ELEMENT REMOVAL

1. CARRY OUT 3D CHECKS.
2. Remove the fan duct from the oven cavity, referring to "FAN MOTOR REPLACEMENT".
3. Disconnect the wire leads from the bottom heating element.
4. Remove the two (2) nuts holding the bottom heating element to the oven cavity right wall.
5. Remove the two (2) nuts holding the bottom heating element to the heater cover with the heat sealed spring at the oven cavity left wall.
6. Remove the bottom heating element from the oven cavity.

GRILL HEATING ELEMENT ASSEMBLY REMOVAL

1. CARRY OUT 3D CHECKS
2. Disconnect the wire leads to the grill heating element.
3. Remove the two(2) screws holding the exhaust duct assembly to the oven cavity.
4. Push the two tabs holding the grill heating element assembly to the oven cavity.
5. Release the grill heating element assembly from the

1. CARRY OUT 3D CHECKS.
2. Remove the control panel assembly referring to "CONTROL PANEL REMOVAL".
3. Disconnect the leads from all switches.
4. Remove the two (2) screws holding the latch hook to the oven cavity.
5. Remove the latch hook.
6. Push the retaining tab slightly and remove the switch.

MONITORED LATCH SWITCH, STOP SWITCH AND MONITOR SWITCH ADJUSTMENT

If the monitored switch, stop switch and monitor switch do not operate properly due to a mis-adjustment, the following adjustment should be made.

1. CARRY OUT 3D CHECKS
2. Loosen the two (2) screw holding the latch hook to the oven cavity front flange.
3. With the door closed, adjust latch hook by moving it back and forward or up and down. In and out play of the door allowed by the latch hook should be less than 0.5 mm. The horizontal position of the latch hook should be placed where the latch head has pushed the plungers of the monitor switch with the door closed. The vertical position of the latch hook should be placed where the latch head has pushed the plungers of the monitored latch switch and stop switch with the door closed.
4. Secure the screws firmly.
5. Make sure all of the switches operate. If the latch head has not pushed the plungers of the monitor switch with door closed, adjust the latch hook position. At that time, the latch head should have pushed the plungers of the monitored latch switch and stop switch. If the latch head has not pushed the plungers of the monitored latch switch and stop switch with door closed, loose two (2) screws holding latch hook to oven cavity front flange and adjust the latch hook position.

After adjustment, make sure of the following:

1. In and out play of door remains less than 0.5 mm when latched position. First check latch hook position, pushing and pulling upper portion of door toward the oven face. Then check the lower latch hook position, pushing and pulling lower portion of door toward the oven face. Both results (plays of the door) should be less than 0.5mm.

- oven cavity by sliding the cover.
6. Now the grill heating element assembly is free.

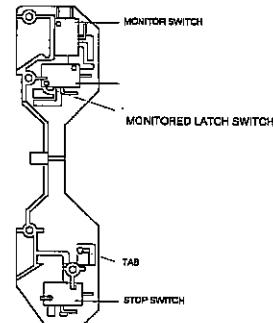

Figure C-5. Switches

2. The monitored switch and stop switch interrupt the circuit before the door can be opened.
3. The monitor switch contacts of (COM - NC) close when the door is opened and the monitored latch switch contacts of (COM - NO) open and contacts of (COM - NC) close when the door is opened.
4. Re-install outer case and check for microwave leakage around the door with an approved microwave survey meter. (Refer to Microwave Measurement Procedure.)

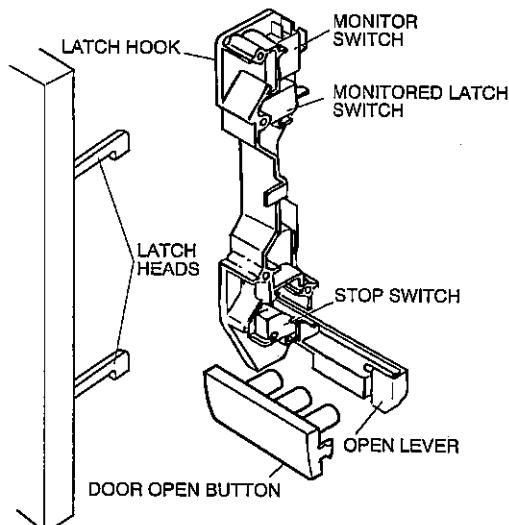

Figure C-6. Switch Adjustment

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

DOOR REPLACEMENT REMOVAL

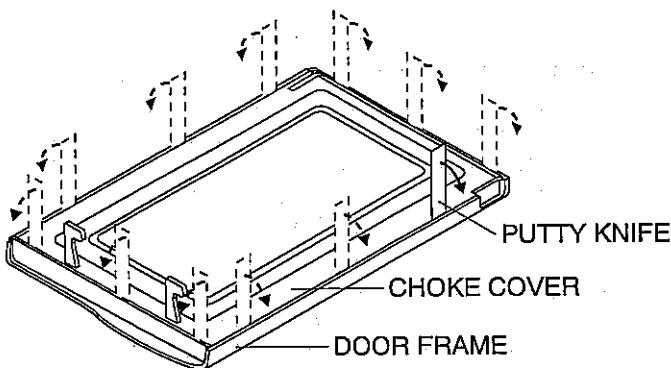

Figure C-5. Door Disassembly

1. CARRY OUT 3D CHECKS.
2. Push the open button and open the door slightly.
3. Insert a putty knife (thickness of about 0.5mm) into the gap between the choke cover and door frame as shown in Figure C-5 to free engaging parts.
4. Release choke cover from door panel.
5. Now choke cover is free.
6. Lift the door upwards.
7. Now, door sub assembly is free from oven cavity.
8. Remove the four (4) screws holding the door panel to the door frame.
9. Release door panel from six (6) tabs of door frame by sliding door panel downward.
10. Now, door panel is free.
11. Slide latch head upward and remove it from door frame with releasing latch spring from door frame and latch head.
12. Now, latch head and latch spring are free.
13. Remove the two (2) screws holding the glass stopper to the door frame.
14. Remove the glass stopper from the door frame.
15. Slide the front door glass leftwards and then slide downwards to release the tabs holding it.
16. Now, the front door glass is free

RE-INSTALL

1. Re-install the front door glass to the door frame as follows. Insert the upper edge of the front door glass into the six (6) tabs of the door frame.
- a) Slide the front door glass downwards and insert the lower edge of the front door glass into the six (6) tabs of the door frame.
- b) Slide the front door glass rightwards and insert the right edge of the front door glass into the one (1) tab of the door frame.
2. Re-install the glass stopper to the door frame as follows. Re-install the glass stopper to the door frame so that the two (2) holes of the glass stopper meet the two (2) pins of the door frame.
- a) Hold the glass stopper to the door frame with the two (2)

3. Re-install the latch spring to the latch head. Re-install the latch spring to the door frame. Re-install latch head to door frame.
4. Re-install door panel to door frame by fitting six (6) tabs of door frame to six (6) holes of door panel.
5. Hold the door panel to the door frame with four (4) screws.
6. Locate door panel hinge pins into cavity hinge location holes.
7. Re-install choke cover to door panel by clipping into position.

Note: After any service to the door;

- (A) Make sure that door sensing switch and primary latch switch are operating properly. (Refer to chapter "Test Procedures".)
- (B) An approved microwave survey meter should be used to assure compliance with proper microwave radiation emission limitation standards. (Refer to Microwave Measurement Procedure.)

After any service, make sure of the following :

1. Door latch heads smoothly catch latch hook through latch holes and that latch head goes through centre of latch hole.
2. Deviation of door alignment from horizontal line of cavity face plate is to be less than 1.0mm.
3. Door is positioned with its face pressed toward cavity face plate.
4. Check for microwave leakage around door with an approved microwave survey meter. (Refer to Microwave Measurement Procedure.)

Note: The door on a microwave oven is designed to act as an electronic seal preventing the leakage of microwave energy from oven cavity during cook cycle. This function does not require that door be airtight, moisture (condensation)-tight or light-tight. Therefore, occasional appearance of moisture, light or sensing of gentle warm air movement around oven door is not abnormal and do not of themselves, indicate a leakage of microwave energy from oven cavity.

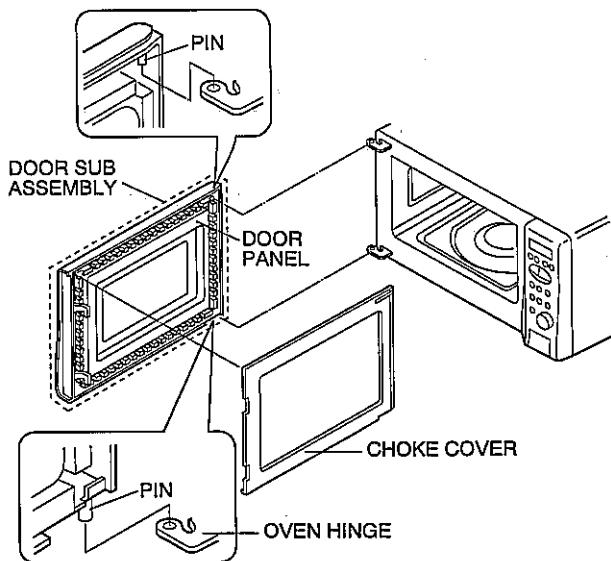

Figure C-6. Door Replacement

MICROWAVE MEASUREMENT

After adjustment of door latch switches, monitor switch and door are completed individually or collectively, the following leakage test must be performed with a survey instrument and it must be confirmed that the result meets the requirements of the performance standard for microwave oven.

REQUIREMENT

The safety switch must prevent microwave radiation emission in excess of 5mW/cm^2 at any point 5cm or more from external surface of the oven.

PREPARATION FOR TESTING:

Before beginning the actual test for leakage, proceed as follows;

1. Make sure that the test instrument is operating normally as specified in its instruction booklet.

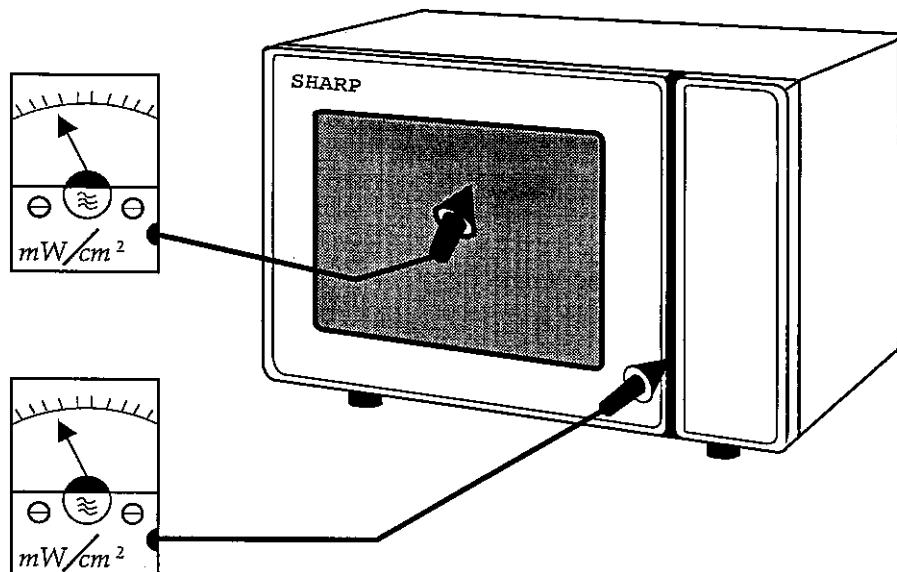

Important:

Survey instruments that comply with the requirement for instrumentations as prescribed by the performance standard for microwave ovens must be used for testing.

Recommended instruments are:

NARDA 8100
NARDA 8200
HOLADAY HI 1500
SIMPSON 380M

2. Place the oven tray into the oven cavity.
3. Place the load of $275 \pm 15\text{ml}$ of water initially at $20 \pm 5^\circ\text{C}$ in the centre of the oven tray. The water container should be a low form of 600 ml beaker with inside diameter of approx. 8.5cm and made of an electrically non-conductive material such as glass or plastic. The placing of this standard load in the oven is important not only to protect the oven, but also to insure that any leakage is measured accurately.
4. Close the door and turn the oven ON with the timer set for several minutes. If the water begins to boil before the survey is completed, replace it with 275ml of cool water.
5. Move the probe slowly (not faster than 2.5cm/sec.) along the gap.
6. The microwave radiation emission should be measured at any point of 5cm or more from the external surface of the oven.

Microwave leakage measurement at 5 cm distance

MICROWAVE MEASUREMENT

TEST DATA AT A GLANCE

| Parts | Symbol | Value / Data |
|------------------------------|--------|--|
| Fuse | F1 | 15A 250V |
